

4J1 – Mass Maintenance of Work Packages and Work Items for Projects

Bot Capability and Feature Highlights

THE PROBLEM

In the normal course of business, the Project Managers perform repetitive tasks on Work Packages when the project is in the 'In Execution' stage. The Project Managers create a new work package, update the existing work package, and create or delete the work items in the work packages.

When a huge volume of these activities is involved, these manual activities can be a very time-consuming and error-prone process.

BOT SKILL DESCRIPTION

- The bot automates the process by fetching the project ID, work packages, and work items from an Excel file.
- Based on a project ID, the bot creates or updates the work packages, and creates or deletes work items for a work package in the SAP S/4HANA Cloud system.
- The bot sends an e-mail notification to the user.

BUSINESS VALUE – BENEFITS

- Reduction of manual effort and time required to update the project with creation/update to work packages and work items.
